Lab Solution: Get started with Databricks Notebook

Q1 - Renaming the Notebook

Change the name of the current notebook to "1.1L - My first lab"

Anwser: to change the name of the notebook, click on the name at the top of this page, then make changes to the name

Q2 - Attaching a cluster

Attach the cluster you created previously to this notebook

Anwser: to attach a cluster to this notebook, click the dropdown near the top-right corner of this page. Select your cluster.

Q3 - Execute a Python code

In the below cell, fill in the blank to print the result of adding the two variables x and y

```
6
```

```
x = 5
y = 10
result = x + y

# Answer
print(result)
```

Q4 - Execute a SQL cell

Change the language in the below cell to execute the SQL statement

```
8
```

```
%sql
SELECT 5 + 10
```

Q5 - Create a Markdown Cell

1. Insert a new cell below this one
2. In the new cell, add Markdown with a header and bullet points as shown in the following image

Animals

- Cats
- Dogs
- Birds

Q6 - Using %run command

1. Create a new Python notebook named **helper** in the current directory (i.e., in the **labs/1- Databricks Lakehouse Platform** folder)
2. In the **helper** notebook, declare a variable called **my_country** and assign it a value of your country name. For example:

```
my_country = "France"
```

3. In the following cell, execute a %run command to include the **helper** notebook into this current notebook

Hint: use a dot (**.**) to refer to the current directory

12

```
%run ./helper
```

Now, run the following cell to test that you are able to print the **my_country** variable

14

```
print(my_country)
```

Q7 - Functions definition

1. In the **helper** notebook, define a Python function named **addition()** that print the sum of two numbers
2. Execute again the above %run command to take the function definition into account
3. Run the below cell to call the function

16

```
num1 = 20
num2 = 30

addition(num1, num2)
```

17
