Lab Solution: Creating a multi-task job

In this lab, we will create a job that has 2 tasks:

1. The current notebook that lands a new batch of data in the lab dataset directory
2. The Delta Live Table pipeline created in the previous lab to processes this data

- Help: Databricks Jobs documentation (https://docs.databricks.com/workflows/jobs/create-run-jobs.html).

Q1- Configuring Task 1 - Land New Data

From the **Workflows** button on the sidebar, under the **Jobs** tab, click the **Create Job** button.

1. Set the job name in the top-left of the screen to **School Job**
2. Configure the first task as specified below:

Setting	Value
Task name	Enter **Land New Data**
Type	Choose **Notebook**
Source	Choose **Workspace**
Path	Use the navigator to choose the current notebook (4.2L - Jobs - Land New Data)
Cluster	Select your cluster from the dropdown, under **Existing All Purpose Clusters**

3. Click the **Create** button

Q2- Configuring Task 2 - DLT pipeline

1. Click the add button (**+**) to add a new **Delta Live Tables pipeline** task
2. Configure the task:

Setting	Value
Task name	Enter **DLT pipeline**
Type	Choose **Delta Live Tables pipeline**

Setting	Value
Pipeline	Choose the DLT pipeline created in the previous lab
Depends on	Choose **Land New Data**, which is the previous task we defined above

Q3- Run the job

Click the **Run now** button in the top right to run this job. From the **Runs** tab, check your job run

Q4- Review the finished job

Once all tasks completed successfully, review the contents of each task to verify its result

> **Note**: The below cells are to be run as part of the **Task 1** to land new batch of data in the dataset directory

```
9
%run ../Includes/Setup-Lab
```

```
10
load_new_json_data()
```

```
11
```
